

SIT120 Pass Task 1

Reflection:

I've divided the body of the webpage I've created into 3 sections, a 'header' section, a 'main' section, and a 'footer' section, including a variety of HTML tags in each. For example, the primary element in the webpage is a table made using the <table> HTML tag. Other tags I've implemented include multiple <div> tags, header tags such as <h1> and <h2>, a paragraph tag (<p>), and a <form> tag.

I've included styling utilizing the 3 required methods; inline (used to add stylings to the <body> element), internal (used to style the <header> object), and external styling via a linked stylesheet. I've used external CSS to manipulate the main table element of the document, as well as the form object below it. Some styling parameters that were altered include background colour, border, width, margin, padding, border-radius, font-size, etc.
